

The Upside-Down Water Bottle

Science Lab · Thursday Sep 10 · Grades 1–2

Name: _____

Date: _____

■ BEFORE — Make Your Prediction!

Setup: bottle full of water, mesh over the top, palm holding it upside down over a tray.

When the teacher removes her palm, the water will...

☐ fall out

☐ stay in

I think this because:

A wooden toothpick pushed through the mesh will float...

☐ UP (toward bottle bottom)

☐ DOWN (toward mouth)

■ WATCH — Draw What You See!

Draw the bottle upside down. Show which way the water and toothpick go. Add arrows!

One thing that surprised me:

■ EXPLORE — Try It Yourself!

How many toothpicks did you push in before it leaked? _____

What happened when you tilted the bottle?

■ AFTER — Reflect!

Was your prediction right?

☐ YES!

☐ NO

The water stayed in because (circle one or both):

☐ air was pushing UP from below

☐ mesh holes were SEALED

The toothpick floated UP because wood is _____ than water.

One question I still have:

■ AIR PRESSURE

air pushes on everything in all directions

■ SURFACE TENSION

water forms a stretchy skin at the surface

■ BUOYANCY

water pushes objects upward
